Minimum Working Examples (MWE) (exercise3)

Why is this not an MWE? Discuss.

How can I get my code to not return an empty list? [closed]

Asked yesterday Modified yesterday Viewed 42 times

0

I am trying to take portions of a dataset, `_2020` (which is an excel file), and put those portions into lists by the appropriate station name. Here is my code:

```
_2020 = pd.read_excel(r'C:\filepath\file.xlsx', 'Stations')

lista_20 = []
listb_20 = []
listc_20 = []

for row in _2020.iterrows():
    if ([_2020['Station Names'] == 'Station_1']):
        lista_20.append(row)
    elif ([_2020['Station Names'] == 'Station_2']):
        listb_20.append(row)
    elif ([_2020['Station Names'] == 'Station_3']):
        listc_20.append(row)
```

Whenever I run, `print(lista_20)`, it prints out the data that is supposed to go into the `listc_20` list.

I expect you to understand what is, and is not, an MWE for the exam.

Speeding up slow processes (exercise4)

Sixteen seconds feels like forever… how to get rid of those eternal 16 seconds?

I expect you to understand the trick that's used here for the exam.

And now: Continue on the Collider

Can you…

(1) Run the collider? (Requires installing ipycanvas into your environment)

(2) Split into groups of two: one of you invites the other as a collaborator on your GitHub repo (the fork you made)?

(3) Each make a branch for development?

(4) Make changes to the collider? The README-collider file has suggestions, but you can do whatever you want.

(5) Incorporate your changes into one merged, updated collider?

Let’s try!

I expect you to know how collaborative coding with Git works for the exam, based on this example.
